

Two-block framework — block-1 Cournot rent + block-2 settlement incidence ($p^*_{DA} = €124/MWh$, Cournot Lerner = 11.7%, persistent in relative terms)

P1 — Settlement-volume ratio $T_{15}/T_{60} = \sqrt{J \cdot (1-\alpha)}$

P4 — Cross-segment incidence invariant (under common α and fixed mix)

P5 — Pigouvian rule redistributes incidence weights ($\beta_R=8$, $\beta_C=220$ €/MWh)
